Incubated by,

Co-Incubated by,

- To develop and deliver advanced digital learning solutions that are tailored to meet the individual needs of students and teachers, while promoting the use of technology to enhance education.
- We strive to provide our customers with the highest quality educational experiences that are affordable and accessible.

Day 1

HTML

Introduction

- HTML stands for HyperText Markup Language.
 - It is used to design web pages using a markup language.
 - HTML is a combination of Hypertext and Markup language. Hypertext defines the link between web pages.
 - A markup language is used to define the text document within the tag which defines the structure of web pages.
 - This language is used to annotate (make notes for the computer) text so that man-readable.
-

Day 2

What is an HTML Element?

- The HTML **element** is everything from the start tag to the end tag:
- `<tagname>Content goes here...</tagname>`
- Examples of some HTML elements:
- `<h1>My First Heading</h1>`
- `<p>My first paragraph.</p>`

HTML Heading

- HTML headings are defined with the `<h1>` to `<h6>` tags.
- `<h1>` defines the most important heading. `<h6>` defines the least important heading.

Example

`<h1>Heading 1</h1>`

`<h2>Heading 2</h2>`

<h3>Heading 3</h3>

<h4>Heading 4</h4>

<h5>Heading 5</h5>

<h6>Heading 6</h6>

Bigger Headings

Each HTML heading has a default size.

However, you can specify the size for any heading with the **style** attribute, using the CSS **font-size** property:

Example

```
<h1 style="font-size:60px;">Heading 1</h1>
```

HTML Paragraphs

The HTML **<p>** element defines a paragraph.

A paragraph always starts on a new line, and browsers automatically add some white space (a margin) before and after a paragraph.

Example

```
<p>This is a paragraph.</p>  
<p>This is another paragraph.</p>
```

A Simple HTML Document

Example

```
EXPLORER FIRST index.html ...
index.html ...
1 <!DOCTYPE html> ...
2 <html lang="en">
3 <head>
4   <meta charset="UTF-8">
5   <meta name="viewport" content="width=device-width, initial-scale=1.0">
6   <title>Heading Title</title>
7 </head>
8 <body>
9 <h1>First Heading</h1>
10 <h2>Second Heading</h2>
11 <h3>Third Heading</h3>
12 <h4>Fourth Heading</h4>
13 <h5>Fifth Heading</h5>
14 <h6>Sixth Heading</h6>
15 <p>My first paragraph.</p>
16 </body>
17 </html>
18 </html>
19
```

OUTPUT:

Day 3

HTML Attributes

- ② All HTML elements can have **attributes**
- ② Attributes provide **additional information** about elements
- ② Attributes are always specified in **the start tag**
- ② Attributes usually come in name/value pairs like: **name="value"**⁷

The href Attribute

The `<a>` tag defines a hyperlink. The `href` attribute specifies the URL of the page the link goes to:

Example

```
<a href="https://www.youtube.com/@HYBELABELS">Visit Hybelabels</a>
```

The src Attribute

The `` tag is used to embed an image in an HTML page. The `src` attribute specifies the path to the image to be displayed:

Example

```

```

There are two ways to specify the URL in the `src` attribute:

1. Absolute URL - Links to an external image that is hosted on another website.

Example: `src=". /Video/BTS_(방탄소년단)_'Dynamite'_Official_MV(1080p).mp4"`.

Notes: External images or videos might be under copyright. If you do not get permission to use it, you may be in violation of copyright laws. In addition, you cannot control external images or videos; it can suddenly be removed or changed.

2. Relative URL - Links to an image that is hosted within the website. Here, the URL does not include the domain name. If the URL begins without a slash, it will be relative to the current page.

Example:

`src="img_girl.jpg"`. If the URL begins with a slash, it will be relative to the domain.

The width and height Attributes

The `` tag should also contain the `width` and `height` attributes, which specify the width and height of the image (in pixels):

Example

```

```

The alt Attribute

The required `alt` attribute for the `` tag specifies an alternate text for an image, if the image for some reason cannot be displayed. This can be due to a slow connection, or an error in the `src` attribute, or if the user uses a screen reader.

Example

```

```

HTML `<button>` Tag

Example

A clickable button is marked up as follows:

```
<button type="button">Click Me!</button>
```

Definition and Usage

- The <button> tag defines a clickable button. Inside a <button> element you can put text (and tags like <i>, , ,
, , etc.). That is not possible with a button created with the <input> element!
 - Tip: Always specify the type attribute for a <button> element, to tell browsers what type of button it is.
-

Background Color

- The CSS `background-color` property defines the background color for an HTML element.

Example

Set the background color for a page to powderblue:

```
<body style="background-color:powderblue;">
<h1>This is a heading</h1>
<p>This is a paragraph.</p>
</body>
```

Example

Set background color for two different elements:

```
<body>
<h1 style="background-color:powderblue;">This is a heading</h1>
<p style="background-color:tomato;">This is a paragraph.</p>
</body>
```

HTML media Attribute

Definition and Usage

- The media attribute specifies what media/device the linked document is optimized for.
- This attribute is used to specify that the target URL is designed for special devices (like iPhone) , speech or print media.

- This attribute can accept several values.

A Example

A link with a media attribute:

```
<video src="../Video/BTS_(방탄소년단)_'Dynamite'_Official_MV(1080p).mp4"
height="350px" width="550px" controls autoplay muted looptype=" " ></video>
```

A Simple HTML Document with Attributes

Example : (Index.html)

```
<!DOCTYPE html>
<html lang="en">
<head>
    <meta charset="UTF-8">
    <meta http-equiv="X-UA-Compatible" content="IE=edge">
    <meta name="viewport" content="width=device-width, initial-
scale=1.0">
    <title>Document</title>
</head>
<body>
    <h1>BTS</h1>
    <h1>Image</h1>
    
    <h1>Introduction</h1>
    <p>BTS (Korean: 방탄소년단; RR: Bangtan Sonyeondan; lit. Bulletproof
Boy Scouts), also known as the Bangtan Boys,
is a South Korean boy band formed in 2010. The band consists of Jin,
Suga, J-Hope, RM, Jimin, V, and Jungkook,
who co-write or co-produce much of their material. Originally a hip hop
group, their musical style has
evolved to incorporate a wide range of genres, while their lyrics have
focused on subjects
including mental health, the troubles of school-age youth and coming of
age, loss, the journey towards self-love,
individualism, and the consequences of fame and recognition.
Their discography and adjacent work has also referenced literature,
philosophy and psychological concepts,
and includes an alternate universe storyline.</p>

<hr>
```

```

<video src=".~/Video/BTS_(방탄소년단)_'Dynamite'_Official_MV(1080p).mp4"
height="350px" width="550px" controls autoplay muted looptype=""
"></video>
<h5>Audio</h5>
<audio src=".~/Audio/BTS_(방탄소년단)_'Dynamite'_Official_MV(128k).m4a"
controls></audio>
</html>

```

OUTPUT :

Day 4

HTML Forms

- An HTML form is used to collect user input. The user input is most often sent to a server for processing.

The `<form>` Element

The HTML `<form>` element is used to create an HTML form for user input:

```
<form>
  .
  form elements
  .
</form>
```

The `<form>` element is a container for different types of input elements, such as: text fields, checkboxes, radio buttons, submit buttons, etc.

All the different form elements are covered in this chapter: [HTML Form Elements](#).

The `<input>` Element

- The HTML `<input>` element is the most used form element.

- An `<input>` element can be displayed in many ways, depending on the `type` attribute.

Text Fields

The `<input type="text">` defines a single-line input field for text input.

Example

A form with input fields for text:

```
<form>
<label for="fname">First name:</label><br>
<input type="text" id="fname" name="fname"><br>
<label for="lname">Last name:</label><br>
<input type="text" id="lname" name="lname">
</form>
```

Radio Buttons

The `<input type="radio">` defines a radio button.

Radio buttons let a user select ONE of a limited number of choices.

Example

A form with radio buttons:

```
<p>Choose your favorite Web language:</p>

<form>
<input type="radio" id="html" name="fav_language" value="HTML">
<label for="html">HTML</label><br>
<input type="radio" id="css" name="fav_language" value="CSS">
<label for="css">CSS</label><br>
<input type="radio" id="javascript" name="fav_language" value="JavaScript">
<label for="javascript">JavaScript</label>
</form>
```

This is how the HTML code above will be displayed in a browser:
Choose your favorite Web language:

HTML CSS

The Submit Button

The `<input type="submit">` defines a button for submitting the form data to a form-handler.

The form-handler is typically a file on the server with a script for processing input data.

The form-handler is specified in the form's `action` attribute.

Example

A form with a submit button:

```
<form action="/action_page.php">
<label for="fname">First name:</label><br>
<input type="text" id="fname" name="fname" value="John"><br>
<label for="lname">Last name:</label><br>
<input type="text" id="lname" name="lname" value="Doe"><br><br>
<input type="submit" value="Submit">
</form>
```

A Simple HTML Application form

Index.html:

```
<!DOCTYPE html>
<html lang="en">
<head>
    <meta charset="UTF-8">
    <meta http-equiv="X-UA-Compatible" content="IE=edge">
    <meta name="viewport" content="width=<device-width>, initial-
scale=1.0">
    <title>Document</title>
</head>
<body>
    <h1>Application Form</h1>
    <form>
        <body bgcolor="black"></body>
        First Name:<input type="text" name="fname" placeholder="First

HTML <section> Element

The <section> element defines a section in a document.

According to W3C's HTML documentation: "A section is a thematic grouping of content, typically with a heading."

HTML <footer> Element

- The <footer> element defines a footer for a document or section.

HTML <header> Element

The <header> element represents a container for introductory content or a set of navigational links.

A <header> element typically contains:

one or more heading elements (<h1> - <h6>)
logo or icon authorship information.

Note: You can have several <header> elements in one HTML document. However, <header> cannot be placed within a <footer>, <address> or another <header> element.

<p>Shin Ha Ri is a single woman and works for a company. She has a male friend, who she has had a crush on for a long time, but she learns he has a girlfriend.</p>
```

Shin Ha Ri feels sad and decides to meet her friend Jin Young Seo, who is a daughter of a chaebol family.

Jin Young Seo then asks Shin Ha Ri to take her place in a blind date and even offers some money for her time.

Shin Ha Ri accepts her friend's offer. She goes out on the blind date as Jin Young Seo, while having the

intention to get rejected by her date. When she sees her blind date, Shin Ha Ri is dumbfounded. Her blind date

is Kang Tae Mu. He is the CEO of the company where she works. Kang Tae Mu is the CEO of a company that

his grandfather founded. One day, his grandfather informed him of an upcoming blind date that he set up for him.

Kang Tae Mu is a workaholic and he is annoyed that his grandfather sets up blind dates for him. He decides

to marry the next woman whom he meets at a blind date, so he won't be disturbed from his work anymore.

That woman is Shin Ha Ri, but pretending to be Jin Young Seo. On the following day, Shin Ha Ri receives a

phone call from Kang Tae Mu. He asks her to marry him. (Source: AsianWiki) ~~

<h4>Cliches done right!</h4>

<p>This is how you incorporate all the cliches without making them annoying. This is how you incorporate humor without making it loud and cringy. This is how you do the perfect rom-com.

Business Proposal felt like a throwback to early 2010 k-dramas and the golden age of romantic comedies, but it modernized it and fixed all the frustrating misunderstandings and miscommunications that made me tear my hair out back then.

I felt like the friendships were such an important part of this show from beginning to end and it made it that much better. The FLs and MLs are each so supportive of each other with their respective family situations, the coworkers are also such a supportive team, and it made the show that much more comforting to watch even when side characters came in to sabotage things as they usually do.

I admit that the ending is a little short and leaves some scenes and closure to be desired —
but I understand that we only had twelve episodes and there probably wasn't much time to spend on
some of the more interesting, non-romance subplots like backstories and family issues.

Nevertheless, if you're looking for something light-hearted and stress-free, this drama is the one.</p>

Day 09

CSS

Introduction:

- CSS stands for Cascading Style Sheets
- CSS describes how HTML elements are to be displayed on screen, paper, or in other media
- CSS saves a lot of work. It can control the layout of multiple web pages all at once
- External stylesheets are stored in CSS files

CSS Syntax

A CSS rule consists of a selector and a declaration block.

- The selector points to the HTML element you want to style.
- The declaration block contains one or more declarations separated by semicolons.
- Each declaration includes a CSS property name and a value, separated by a colon.

Example

In this example all <p> elements will be center-aligned, with a red text color:

```
p {  
color: red;  
text-align: center;31  
}
```

Example Explained

- `p` is a selector in CSS (it points to the HTML element you want to style: <p>).
- `color` is a property, and `red` is the property value
- `text-align` is a property, and `center` is the property value

CSS background-color

The background-color property specifies the background color of an element.

Example

The background color of a page is set like this:

```
body {  
background-color: lightblue;  
}
```

With CSS, a color is most often specified by:

- a valid color name - like "red"
- a HEX value - like "#ff0000"
- an RGB value - like "rgb(255,0,0)"

Look at CSS Color Values for a complete list of possible color values.

Day 10

CSS Colors

Colors are specified using predefined color names, or RGB, HEX, HSL, RGBA, HSLA values.

CSS Background Color

You can set the background color for HTML elements:

Hello World

Lorem ipsum dolor sit amet, consectetuer adipiscing elit, sed diam nonummy nibh euismod tincidunt ut laoreet dolore magna aliquam erat volutpat. Ut wisi enim ad minim veniam, quis nostrud exerci tation ullamcorper suscipit lobortis nisl ut aliquip ex ea commodo consequat.

Example

```
<h1 style="background-color:DodgerBlue;">Hello World</h1>
<p style="background-color:Tomato;">Lorem ipsum...</p>
```

CSS background-color

The `background-color` property specifies the background color of an element.

Example

The background color of a page is set like this:

```
body {
background-color: lightblue;
```

CSS Selectors

CSS selectors are used to "find" (or select) the HTML elements you want to style. We can divide CSS selectors into five categories:

The CSS Grouping Selector

The grouping selector selects all the HTML elements with the same style definitions.

Look at the following CSS code (the h1, h2, and p elements have the same style definitions):

```
h1 {
text-align: center;
color: red;
}
h2 {
text-align: center;
color: red;
}
p {
text-align: center;
color: red;
}
```

It will be better to group the selectors, to minimize the code.
To group selectors, separate each selector with a comma.

Example

In this example we have grouped the selectors from the code above:

```
h1, h2, p {  
    text-align: center;  
    color: red;  
}
```

CSS Layout - The z-index Property

The z-index property specifies the stack order of an element.

The z-index Property

When elements are positioned, they can overlap other elements.

The z-index property specifies the stack order of an element (which element should be placed in front of, or behind, the others).

An element can have a positive or negative stack order:

This is a heading

Because the image has a z-index of -1, it will be placed behind the text.

Example

```
img {  
    position: absolute;  
    left: 0px;  
    top: 0px;  
    z-index: -1;  
}
```

Day 11 & 12

PROJECT 2

NEXFLIX WEBSITE CLONE USING HTML AND CSS

OUTPUT:

Day 13

JAVASCRIPT

Introduction

- JavaScript is the world's most popular programming language.
- JavaScript is the programming language of the Web.
- JavaScript is easy to learn.

JavaScript Can Change HTML Content

One of many JavaScript HTML methods is `getElementById()`.

The example below "finds" an HTML element (with `id="demo"`), and changes the element content (`innerHTML`) to "Hello JavaScript":

Example

```
document.getElementById("demo").innerHTML = "Hello JavaScript";
```

JavaScript accepts both double and single quotes:

Example

```
document.getElementById('demo').innerHTML = 'Hello JavaScript';
```

JavaScript Can Change HTML Attribute Values

In this example JavaScript changes the value of the src (source) attribute of an tag:

The Light Bulb

JavaScript Functions

- A JavaScript function is a block of code designed to perform a particular task.
- A JavaScript function is executed when "something" invokes it (calls it).

Example

```
// Function to compute the product of p1 and p2
function myFunction(p1, p2) {
  return p1 * p2;
}
```

JavaScript Function Syntax

- A JavaScript function is defined with the function keyword, followed by a name, followed by parentheses () .
- Function names can contain letters, digits, underscores, and dollar signs (same rules as variables).
- The parentheses may include parameter names separated by commas: (parameter1, parameter2, ...)
- The code to be executed, by the function, is placed inside curly brackets: {}

- function name(parameter1, parameter2, parameter3) {
 // code to be executed
}
 - Function parameters are listed inside the parentheses () in the function definition.
 - Function arguments are the values received by the function when it is invoked.
 - Inside the function, the arguments (the parameters) behave as local variables.
-

Day 14

JavaScript Events

- HTML events are "things" that happen to HTML elements.
 - When JavaScript is used in HTML pages, JavaScript can "react" on these events.
-

HTML Events

An HTML event can be something the browser does, or something a user does.

Here are some examples of HTML events:

An HTML web page has finished loading

An HTML input field was changed

An HTML button was clicked

Often, when events happen, you may want to do something.

JavaScript lets you execute code when events are detected.

- HTML allows event handler attributes, with JavaScript code, to be added to HTML elements.

With single quotes:

```
<element event='some JavaScript'>
```

With double quotes:

```
<element event="some JavaScript">
```

In the following example, an onclick attribute (with code), is added to a <button> element:

Example

```
<button onclick="document.getElementById('demo').innerHTML = Date()">The time  
is?</button>
```

In the example above, the JavaScript code changes the content of the element with id="demo".

Day 15

BOOTSTRAP

Introduction

Bootstrap is a free front-end framework for faster and easier web development

Bootstrap includes HTML and CSS based design templates for typography, forms, buttons, tables, navigation, modals, image carousels and many other, as well as optional JavaScript plugins

Bootstrap also gives you the ability to easily create responsive designs

What is Responsive Web Design?

Responsive web design is about creating web sites which automatically adjust themselves to look good on all devices, from small phones to large desktops.

Create First Web Page With Bootstrap

1. Add the HTML5 doctype

Bootstrap uses HTML elements and CSS properties that require the HTML5 doctype.

Always include the HTML5 doctype at the beginning of the page, along with the lang attribute and the correct character set:

```
<!DOCTYPE html>  
<html lang="en">  
  <head>  
    <meta charset="utf-8">  
  </head>  
</html>
```

2. Bootstrap 3 is mobile-first

Bootstrap 3 is designed to be responsive to mobile devices. Mobile-first styles are part of the core framework.

To ensure proper rendering and touch zooming, add the following <meta> tag inside the <head> element:

```
<meta name="viewport" content="width=device-width, initial-scale=1">
```

The width=device-width part sets the width of the page to follow the screen-width of the device (which will vary depending on the device).

The initial-scale=1 part sets the initial zoom level when the page is first loaded by the browser.

Day 16 & 17

PROJECT 3(Final project)

MY PORTFOLIO

Index.html

```
<!DOCTYPE html>
<html lang="en">
<head>
<meta charset="UTF-8">
<meta name="viewport" content="width=device-width, initial-scale=1.0">
<title>My Portfolio</title>

Hello, I'm
Girisaa Priyadharsini

Video/Audio Editor

Hello everybody, This is a promotion for my editing pages as well as my personal portfolio.

Additionally, you can ask me to alter your favourite stars or television shows. If you're not a fan of LGBTQ+ content, you can leave my website. I don't have any issues with it.

Script.js

```
// Sticky Navbar
let header = document.querySelector('header');
let menu = document.querySelector('#menu-icon');
let navbar = document.querySelector('.navbar');

window.addEventListener('scroll', () => {
  header.classList.toggle('shadow', window.scrollY > 0);
});
menu.onclick = () => {
  navbar.classList.toggle('active');
}
window.onscroll = () => {
  navbar.classList.remove('active');
}

// Dark Mode
let darkmode = document.querySelector('#darkmode');

darkmode.onclick = () => {
  if(darkmode.classList.contains('bx-moon')){
    darkmode.classList.replace('bx-moon','bx-sun');
    document.body.classList.add('active');
  }else{
    darkmode.classList.replace('bx-sun','bx-moon');
    document.body.classList.remove('active');
  }
}
```
